

## The STEPS Difference: 16 Years of Attracting Girls to Careers in Science, Technology, Engineering & Mathematics

Brenda S. Puck and Wendy R. Stary  
University of Wisconsin-Stout

### ABSTRACT

The Science, Technology, Engineering Preview Summer Program (STEPS) at the University of Wisconsin-Stout is a one-week experience initiated in 1997 that will celebrate its 16<sup>th</sup> anniversary during the summer of 2012. The main purpose of STEPS is to introduce girls and young women to the excitement of careers in science, technology, engineering, and mathematics related fields through manufacturing experiences. A fundamental component of that goal is to inspire them to select the appropriate math and science courses in middle and high school prepare for these majors and these careers. A project-based experiential learning curriculum is used for the program which focuses on the manufacture and assembly of a radio-controlled device. For the first ten years of the program it was a model airplane, and the last five years a model boat. To date, approximately 2,400 girls have participated in STEPS for Girls at the University of Wisconsin-Stout and the program has also been replicated at other institutions. Survey data from these STEPS participants and alumnae have revealed that the program has had a significant impact on their perception of science, technology, engineering, and mathematics, as well as their career pursuits. This paper will present the experiential learning curriculum and projects that have been developed, and proven successful, for use in this program.

Keywords: STEM, Conference Proceedings, K-12 Outreach, Girls/Women in STEM

### INTRODUCTION

#### Science, Technology and Engineering Preview Summer (STEPS) Program

In 1997, the University of Wisconsin-Stout, in partnership with the Society of Manufacturing Engineering Education Foundation (SME-EF), initiated an outreach program for girls entering the seventh grade. The original impetus for STEPS program founder, Pete Heimdahl, and his colleagues, was related to a lack of women available to teach in engineering education programs. It was decided that middle school age girls would be the appropriate candidates from both a human development and academic perspective. (Spencer, 2008; Berenbaum, Martin, & Ruble, 2008)

“STEPS for Girls” is a one-week introduction to the world of manufacturing. Manufacturing provides an applied experience that allows the girls to see a direct connection between science, mathematics, and technology, and how they are used by professionals in engineering-related careers. For ten years, the girls manufactured radio-controlled model airplanes from raw materials. During the past five years, the participants have produced radio-controlled model boats. Next year, the participants will begin manufacturing battery powered robots. Each participant creates her own product, tests it, and takes it home with her.

The components are fabricated in various laboratory activities using real production equipment. “STEPS for Girls” participants gain direct hands-on experience in mathematics, physics, chemistry, packaging, computer-aided design, rapid prototyping, computer-aided

## 2012 ASQ Advancing the STEM Agenda in Education, the Workplace and Society Session 2-3

manufacturing, CNC machining, metals casting, plastics processing, robotics, web-page development, and printing. (Bee, Puck, & Heimdahl, 2003)

“Advanced Steps” is a one-week experience that serves to reinforce the concepts presented in the first STEPS program; provide an advanced engineering design and problem-solving experience; and offer more specific information about career opportunities in science, technology, engineering, and mathematics. Team problem-solving activities are inspired by the *FIRST*® LEGO® League (FLL®) competition strategy, and utilize the LEGO® Mindstorms® robotic technology (FIRST, 2012). The advanced program has been offered four times over the past six years. Participants are alumnae from the program at the University of Wisconsin-Stout, or one of the institutions that have replicated the STEPS concept.

Industry, University, and SME-EF support are keys to the success of this program. Initially free to all participants, the program now charges a nominal \$450 fee for the week of activities. This tuition rate is approximately one half of the per participant cost to produce the program. The seventh grade outreach program, which completed its fifteenth program summer in 2011, now has 2400 female graduates. Advanced STEPS has 160 alumnae. Twenty-five percent (25%) of participants in each program year receive donor supported scholarships due to low income status. On August 2, 2012, STEPS will celebrate its sixteenth anniversary.

### STEPS for Girls – A Brief Overview

STEPS for Girls was designed to be a set of intense immersion activities that provides technical (process and production systems), developmental (personal development and leadership), and recreational experiences. From arrival of the participants on Sunday afternoon until departure on Thursday afternoon, there are 52.5 hours of scheduled time other than routine meals. The following shows the balance among the various types of activities:

1. Technical Activities            20.0 hours
2. Developmental Activities    18.0 hours
3. Recreational Activities       14.5 hours

Technical activities are currently designed around the manufacture of a radio-controlled model boat. The boat is final assembled in the STEPS Production Lab after other lab activities produce parts as “subcontractors” or provide analyses and information as “consultants.” Several of the activities in the production of the boat are described as follows:

#### *Subcontractors:*

Foundry:	Casting aluminum steering console
Plastics:	Thermoforming deck, hull, and electronics cover
Packaging:	Automated fabrication of a corrugated paper container to protect, and communicate
Electronics:	Production of wiring harness

#### *Consultants:*

Physics:	Theory of buoyancy
----------	--------------------

**2012 ASQ Advancing the STEM Agenda in Education, the Workplace and Society  
Session 2-3**

Chemistry:	Different ways to power boats
Mathematics:	Analysis of weight and balance
CADD:	Manipulation and modification of 2-D and 3-D CADD visualization renderings of the boat
Automation and Robotics:	Computer integrated machining and manufacturing concepts
Information Technology:	Assembly of a computer, discover and analysis of information communication systems concepts
Web Design:	Development of web pages, and use of software to communicate information
Graphic Arts:	Produce a newsletter, and screen print a tote bag to carry artifacts created at STEPS

The activities provide an interesting view of the excitement experienced by those who pursue a career in science, technology, engineering, and mathematics and what it takes to achieve and succeed in one. All of these activities are presented by University of Wisconsin-Stout science, technology, engineering, and mathematics faculty members or professionals in the field, most of whom are women.

The culminating technical activity is the Wednesday and Thursday afternoon Regatta. The participants then control their boat in the STEPS pool which is 60 feet long by 10 feet wide by 9 inches deep. Several activities have been created to allow the participants master the skill of maneuvering their boat using radio control units. A team of two participants attempt to rescue a Bratz® boy doll before a radio-controlled shark gets him in the final activity. Bleachers are provided for spectators.

### **Advanced STEPS – A Brief Overview**

Advanced STEPS for Girls was conducted on the University of Wisconsin-Stout campus for the first time in the summer of 2006. The one-week experience was offered to alumnae of the 7<sup>th</sup> grade STEPS program of 2003. The goals of Advanced STEPS program concept developed out of a request from alumnae and their parents for an opportunity to reinforce the career message of the 7<sup>th</sup> grade STEPS program in the minds of participants with continued interest. This experience provides another opportunity to significantly influence the selection of science, technology, engineering, or mathematics as a participant's career choice. It also offers young woman an engineering design and problem solving experience.

The week focuses on an unstructured design experience for the Advanced STEPS participants. The design activity is deliberately designed to be “messy”, as all design experiences are, with multiple solutions possible. The LEGO® Mindstorms® robotic technology is the foundation upon which the technical activities of the 10<sup>th</sup> grade experience are based. As 15-year-olds, the advanced participants are more likely to possess the cognitive skills appropriate for an advanced engineering design experience than when they were 12. The week is spent teaching the concepts of robotics and controls to the participants in order for them to be able to accomplish a major project by the end of the week.

There is four instructional staff, LEGO® Professors, and four LEGO® Team Mentors required for staffing this week long summer experience. The LEGO® Professors conducted

## 2012 ASQ Advancing the STEM Agenda in Education, the Workplace and Society Session 2-3

the instructional activities, and the LEGO® Mentors, all of whom are either STEPS alumnae, or female college age students in one of the science, technology, engineering, or mathematics programs at the University of Wisconsin-Stout. One LEGO® Mentor is assigned to a team of participants. The mentors are responsible for guiding the teams through the brainstorming, problem solving, and technical matters of robot design and programming. The team members are responsible for developing their own solutions to the design project.

The project, created in true Rube Goldberg style, is a fun problem to be addressed autonomously by each of the four teams. The Official Rube Goldberg Web Site defines a “Rube Goldberg” as “a comically involved, complicated invention, laboriously contrived to perform a simple operation.” (Rube Goldberg, Inc., 2012) Rube Goldberg was a Pulitzer Prize winning cartoonist, sculptor and author who is best known for hilariously depicted drawings of his “inventions.”

The first design project in 2006, “Rube’s Smart House”, had the context that a family would be out of town for a full week and needed to have certain household functions occur within the house while they were gone. During the program for 2007, 2008, and 2009 a challenge theme was chosen from the *FIRST*® LEGO® League (FLL®) archives. (FIRST, 2012) The design project was introduced to the participants at the end of the first day.

Each team has access to its own 4 x 8 foot table that remains from the *FIRST*® LEGO® League (FLL®) competition hosted by the University of Wisconsin-Stout each year. The design project challenge require the participants to analyze the design problem, research concepts related to the problem, brainstorm ideas, create and develop solutions, and test their solution in a friendly competition with the other teams. The teams also present their solutions to a team of professionals. The professionals mentor the teams through assessment and supportive counsel.

Several instructional activities, conducted by the LEGO® Professors, help the participants learn how to program the LEGO® Mindstorms® control unit, function as a team in creative problem solving, utilize sensors available on the LEGO® Mindstorms® control unit, and build mechanical mechanisms utilizing LEGO® building sets. After this initial day of activities, the teams are turned loose on designing their solutions to the design project for the remainder of the design time. The energy and excitement of the teams is contagious.

In addition to the assessment and mentoring of teamwork, programming, and design, the teams’ best performance in solving the design challenge is factored into the awards process. Awards are given in the following classifications: Director’s Award (the strongest overall in all categories), Programming/Design Award, Judge’s Award (most improved team over the course of the week), Teamwork Award, and Gracious Professionalism Awards (given to one member of each team that exemplified the spirit of gracious professionalism).

As in the STEPS program previously discussed, adequate time is spent in recreational and developmental activities, including the Adventure Challenge team skills course, swimming, recreation centers, and industry tours. It is important to provide a balanced approach of recreational and developmental activities along with the creative design experience provided through the project.

### **Junior Counselors and Lab Assistants**

Based on the success of Advanced STEPS, two new components to the STEPS for Girls program were initiated. In 2007, STEPS introduced the Junior Counselor position as a leadership opportunity for the tenth grade alumnae to mentor to the younger participants. An alumna applies for a one week assignment. The STEPS Lab Assistant position for eleventh and twelfth grade alumnae was introduced in 2008. The Lab Assistant opportunity allows the more mature alumnae to learn technical skills while assisting faculty and staff, and mentoring

to the younger participants. The Lab Assistants apply to serve either a two or four week assignment.

### **LITERATURE REVIEW**

The STEPS for Girls program was created fifteen years ago due to the inability of the program founders to find women to teach at the post-secondary level in engineering related fields. Attentive to the importance of role models to the development of perceptions in human development, they decided to “grow their own”. (Berenbaum, Martin, & Ruble, 2008) The STEPS mission is to reach girls and young women with solid information about the excitement of a career in science, technology, engineering, and mathematics, and what it takes to achieve and succeed in one. A goal toward achieving this mission is to inspire participants to prepare themselves for these careers by taking the appropriate courses in middle and high school. The program motto of “It’s okay to be cute and smart” serves to increase self-esteem and empower participants toward this goal.

High school girls want careers that are relevant and rewarding, make a difference, and pay well (Sinkele & Mupinga, 2011). Unfortunately, they are often given the misconception about engineering that it is a stressful occupation requiring high achievement in math and science. This perception needs to change if more young women are to be recruited into the engineering fields. Positive influence in this direction can come from the true stories of women engineers who are making a good living while creatively solving real-life problems and positively impacting society along the way. Beyond witnessing the successes of others, women’s participation in science and engineering is rooted in current and historic participation in these fields, differences in educational attainment for women, and in precollege course taking and achievement. (National Science Foundation, Division of Science Resource Statistics., 2011)

There are plenty of potential female candidates out there. The 2010 Bureau of Labor Statistics report indicates that women currently make up 50.7% of all US residents with 1.5M of these women having graduated from high school in 2010. (United States Department of Labor, 2011) Seventy-four percent of the 2010 female high school graduates enrolled in college. Yet, using the latest Engineering Workforce Commission data (2008), only approximately 1.2% of them enrolled in engineering fields. In addition about 5.2% of all U.S. female high school graduates enroll in natural science baccalaureate programs each year. These statistics equate to an extremely large proportion of highly qualified women not entering engineering, technology, or natural science career choices. (National Science Foundation, Division of Science Resource Statistics, 2011)

One possible explanation for the shortfall of women entering engineering fields is that masculine norms or codes of conduct, which are not conducive to diversity, dominate the workplace culture leaving women as outsiders (Bastalich, Franzway, Gill, Mills, and Sharp, 2007). Moreover, the current low numbers of women in science and engineering have the potential to lead to stereotyping of performance, difficulty achieving credibility amongst peer or administrators, and lack of mentoring for future female engineers (Rosser, 2004).

In most career fields, women’s participation has increased over the past two decades. (National Science Foundation, Division of Science Resource Statistics., 2011; American Association of Engineering Societies, 2010). Since 1989 more women are pursuing careers in social sciences, and biosciences. Although, women are still earning fewer degrees in physical sciences and mathematics, a recent American Association of Engineering Societies (AAES) survey shows that women receiving BS degrees in engineering increased in number and percentage for the first time in three years.

## METHODOLOGY

The methodology used is a longitudinal study of survey data collected at intervals of pre-experience, post-experience, and 10<sup>th</sup> grade. The surveys for pre and post-experience are administered electronically, or via paper to the young ladies while they were on campus. The first three years of participants, alumnae from 1997, 1998, and 1999 were administered a longitudinal survey via paper through the mail in 2005. For the upcoming longitudinal surveys electronic methods will be introduced for distribution and collection of results.

## FINDINGS

### STEPS for Girls – A Significant Impact on College Program of Study

The 2011 STEPS pre and post experience surveys reveal that when STEPS participants graduate from high school or college, they have a strong interest in pursuing careers in the fields of science, technology, and engineering. This interest is enhanced by participation in STEPS. The participants interest in these areas increased by five and fifteen percent respectively on the post experience survey. The participant's survey responses also reveal a slight increase in interest for careers in mathematics. In preparation for these career endeavors, the participants also expressed an increased interest in taking courses related to science, technology, engineering, and mathematics.

The first program graduates are now in their mid to late twenties. Follow-up surveys of the first three years of participants indicate significant impacts on their career pursuits. The survey was focused on determining the college program of study chosen by the STEPS classes of 1997, 1998, and 1999. It also sought to determine the influence STEPS had in their program of study. The average influence rank assigned by the graduates was 3.5 out of 5 indicating that they felt STEPS had an important influence on their career choice. The percentages of graduates pursuing an engineering or scientific program of study vary from a combined sum of 33 to 45%.

According to the follow-up survey administered to the STEPS graduates, 11.5% of the survey respondents have indicated a program of study in engineering and technology. This is an extremely significant finding. It indicates that STEPS graduates are 2.9 times more likely to pursue engineering or technology careers when compared to the national average of 3.9% in 2004. If the 1.5 million female high school graduates enrolled in engineering and technology programs at the same rate as STEPS graduates, the number would exceed the total engineering and technology annual enrollment which was last reported at about 111,006 in 2008. (National Science Foundation, Division of Science Resource Statistics, 2011)

According to the follow-up survey administered to the STEPS graduates, 25.0% of the survey respondents have indicated a program of study in natural sciences. This is also a significant finding. It indicates that STEPS graduates are 2.3 times more likely to pursue a scientific career pursuit when compared to the 2004 national average of 10.9% of high school graduates.

The next longitudinal survey to help measure the long-term impact of the STEPS program is being developed for online implementation during the summer of 2012. The testimonials received from alumnae continue to provide qualitative data to support the positive impact of the program on the future choices that these girls and young women make in the areas of science, technology, engineering, and mathematics. The following quote is an example of this feedback:

*“Since the first time I attended STEPS, I have known that I want to go into engineering. Without attending STEPS, I do not know where I would be in career*

## 2012 ASQ Advancing the STEM Agenda in Education, the Workplace and Society Session 2-3

*interests. STEPS camp changed my life, and I hope that I have helped another young girl realize that maybe the engineering field is for her. This camp has an amazing mission and I am very happy to have helped achieve this.” ~ Madeline H.*

A measure of the success of the STEPS program is the continued demand for the program. The program reaches the full capacity of 160 participants each year, and also maintains a waiting list of hopeful applicants. Requests are being received for the following year as soon as, if not before the current year is finished. Both the Junior Counselor and Lab Assistant positions have become so popular that approximately sixty applications are received each year for sixteen or eighteen positions respectively.

A survey administered to the alumnae following these experiences indicates that all participants enjoyed the experience, learned something new, and plan to go to college or pursue education past high school. Responses also indicate that almost forty-two percent of participants are interested in attending the University of Wisconsin-Stout for that education. Approximately forty-two percent of these alumnae expressed an interest in pursuing a career in science, thirty-three percent a career in engineer and technology, and the remainder plan a career in education.

### SUMMARY

Over the past fifteen years STEPS has evolved from an introduction to the world of manufacturing to a program that ignites and inspires girls and young women to take the courses necessary to prepare for citizenship and work in a technological society. It provides opportunities to support the alumnae at critical points in the human development process.

### SUGGESTIONS FOR BEST PRACTICES

The survey data shows that a hands-on, minds-on learning approach through the designing, building, and testing of a manufactured product is a key component of the success of the program. The product itself does not seem to be as critical as the creation of experiential learning activities that are fun and attend to female pedagogy. Many parents have also expressed an interest in attending the program themselves.

Pedagogy is the “art, science, or profession of teaching” as related to the “knowledge and development resulting from an educational process.” (Merriam-Webster, Inc., 2012) Research conducted by social psychologists provides a foundation for structuring learning activities based on diversity in development based on gender. This diversity has implications that reach far beyond chromosomal, hormonal, and genital differences. Although the issues surrounding gender are still somewhat controversial, the current research provides theoretical perspectives for the development of learning activities that attend to this gender diversity. (Berenbaum, Martin, & Ruble, 2008)

Appropriate facilities, faculty, and funding are also necessary to the overall success of the program and need to be maintained from year to year to ensure a high level of quality. Several attempts to replicate the STEPS program by institutes without adequate facilities have failed. The facilities that are usually deficient include a foundry, a plastics laboratory, a metal forming and material removal laboratory, and a packaging laboratory. Because the STEPS curriculum is an interactive learning environment, it is important to have facilities and equipment that allow the participants a “hands-on, minds-on” learning activity. A dedicated and passionate group of faculty provides the year-round energy needed to plan, organize, implement, and assess the success of this program. Lastly, and most importantly a sustainable source of funding, as well as an economically conscientious budget that looks beyond purchase and production is crucial to the best practices for longitudinal program

survival. In order to maintain the utmost quality in each of these areas, a continuous improvement process is vital. At a minimum, this should include an annual “lessons-learned” review immediately following the completion of the final session of the summer program.

### **CONCLUSIONS**

STEPS for Girls is an unqualified success. The University of Wisconsin- Stout with the assistance of sponsors will continue to offer this excellent program. Advanced STEPS for Girls builds on the success of the 7<sup>th</sup> grade program experience and provides a 10<sup>th</sup> grade design experience. Advanced STEPS, Junior Counselor, and Lab Assistant experiences will all further solidify the career choices into engineering and technology. This summer program will continue to achieve the primary goal of attracting and encouraging women to pursue engineering and technology careers. In addition, STEPS for Girls participants have developed an overall appreciation of engineering, technology, science, and mathematics even if they choose other career pursuits.

Through pre- and post-experience surveys, STEPS for Girls and Advanced STEPS participants have shown that they leave STEPS for Girls with a high level of appreciation for the kind of work a scientist or engineer performs, and this knowledge is retained when they return for Advanced STEPS. The survey results also indicate that STEPS for Girls doubles the interest in pursuing an engineering or scientific career. The Advanced STEPS surveys indicate that the group of selective students participating is better than 50% likely to pursue an engineering or scientific career.

While the quantitative data presented indicates the both the success and worthiness of STEPS for Girls, some of the best evidence in support of this program is qualitative. The following unsolicited quote came to us from a parent:

*“My daughter attended STEPS for Girls two summers ago... She has gained so much from it I can't put it into words. Her self-confidence has skyrocketed to the moon. Her grades have followed. Old grades were 2.5 – 2.7 range. Since STEPS, 3.7 – 4.0. Yes, straight A's a couple times. Our entire family attributes the change to the STEPS for Girls Program. She is a real leader and go-getter the last couple years. She always tells us that “she found out that she wasn't dumb” at the camp. No other changes in her life. She has surrounded herself with great friends and consistently gets high remarks from her instructors in school. Truly an amazing life change for her.*

The University of Wisconsin-Stout deems this program to be exceptional and encourages all universities to consider developing an outreach activity modeled after STEPS for Girls and Advanced STEPS.

### **FUTURE WORK/RESEARCH**

Planning has begun on a collaboration project with the School of Education at the University of Wisconsin-Stout to create Professional Development opportunities for in-service teachers related to promoting gender equity in science, technology, engineering, and mathematics. The proposed collaboration aspires to “improve teachers’ abilities to attract and mentor female students in science, technology, engineering, and mathematics-related career paths by: (Tiala, Mason, & Bauer, 2012)

- Providing professional development related to increasing knowledge related to creating a “gender equitable” pipeline for young women entering STEM fields.

## 2012 ASQ Advancing the STEM Agenda in Education, the Workplace and Society Session 2-3

- Providing professional development in evidence-based factors influencing female participation in STEM-related courses.
- Developing “best practices” that encourage female participation in STEM activities.
- Conducting classroom-based research relative to identified “best practices”.
- Building collaborative relationships among project participants.”

Development and initial implementation is anticipated to take about one year. The first professional development workshops are proposed to take place during STEPS 2013. Compilation and planning for dissemination of the initial results will begin during the fall of 2013.

Two new initiatives are being developed to provide further information and encouragement to all STEPS alumnae about opportunities for women in science, technology, engineering, and mathematics, and attempt to track the alumnae longitudinally. First, updates to the STEPS web site at [www.uwstout.edu/steps](http://www.uwstout.edu/steps) will allow alumnae to update contact information, complete surveys, and apply for positions online. The other is a collaboration project with the Admissions Office at the University of Wisconsin-Stout to offer more concrete career information and track those STEPS alumnae who enroll in programs at the University of Wisconsin-Stout.

A plan for pursuit of sustainable funding sources for the future of the STEPS program is being developed. Financial support for the program has declined in spite of the program’s success. Various economic instruments are being investigated including grants, sponsorship, tuition rates, and donations.

A new autonomous robot project, the Beetle Bot, is being developed to replace the boat project. The Beetle Bot is scheduled to begin production during STEPS in 2013. The largest benefit this product change will provide is related to material availability and cost. Other benefits to the curriculum include retention of rigor within science, technology, engineering, and math concepts, and more time for manufacturing processes and concept presentation.

### AUTHORS INFORMATION

Brenda S. Puck is a lecturer in the Technology and Engineering Department at the University of Wisconsin-Stout. She teaches a variety of courses in support of the Technology Education and Engineering Technology programs. She earned a B.A. in Aviation Management and International Business at the College of Saint Teresa in Winona, MN and her M.S. in Technology Education from the University of Wisconsin-Stout. She has over 14 years of experience in the commercial and general aviation industry and has a private pilot's license. Her Master's studies focused on women and technology, especially the preparation of girls and young women for life in a technological society. She has been on the STEPS for Girls faculty and staff since 1998, most recently as Activities Director, responsible for the technical instruction of the participants. She assumed the position of STEPS for Girls Executive Director in 2010. Ms. Puck can be reached at [puckb@uwstout.edu](mailto:puckb@uwstout.edu)

Wendy R. Stary is an Assistant Professor for the Plastics Engineering Program in the Technology and Engineering Department at the University of Wisconsin-Stout. She earned a B.S. and M.S. in Manufacturing Engineering at the University of Wisconsin-Stout. She has many years of experience in industry. She has also been on the STEPS for Girls faculty and staff for many years. She has served as a Lab Assistant, a LEGO® Mentor, an Advanced STEPS Programming Instructor, and the STEPS Plastics Activity Instructor. Ms. Stary can be reached at [staryw@uwstout.edu](mailto:staryw@uwstout.edu)
